

KeyView™ Prep Selection Flow Chart

220nm Laser Source

220nm is often used in protein and DNA analysis. The added wavelength can be helpful in discerning peaks that are close together.

Material of Flow Cell

The biocompatible material, or PEEK, is resistant to most solvents. Stainless steel is more robust and capable of higher flow rates and pressures.

Flow Rate

Select the model with the flow rate above which is closest to your intended process capacity. The biocompatible flow cells are not available for 10L/min flow.
